

Apps for TikTok — Mac App Store Submission Evidence

Prepared by: Mihai Graure / Apps for TikTok Development Team

Date: July 16, 2026 · App ID: 6783051609 · Bundle: com.mihai.appsfortiktok

1. Purpose of This Document

This document has been prepared in response to Apple's request for documentary evidence under Guideline 5.2.3 (Legal — Third-Party Content) for Submission ID f336b5bf-8b92-488f-a6f8-601d87b8561e. It explains the technical architecture of *Apps for TikTok*, the legal basis for its operation, and why no third-party authorization from TikTok Inc. is required for its distribution on the Mac App Store.

2. Application Architecture

Apps for TikTok is a native macOS desktop productivity application built on Electron (Chromium + Node.js). Its core function is to render TikTok's publicly accessible web interface at <https://www.tiktok.com> inside a native macOS window using Electron's BrowserView component, which is technically equivalent to an embedded Chromium browser.

The application provides the following native-layer productivity features:

- Multi-account workspace management (native sidebar)
- macOS Focus Mode / Do Not Disturb integration
- Native notification badge management via NSApplication
- AI-powered reply suggestions (calls OpenAI API with user-entered key)
- Native macOS menu bar, keyboard shortcuts, and window management
- Message scheduling reminders (local, no server-side component)

The application does **not** contain any TikTok content, media files, API keys, or data — it is a shell. Every piece of audio, video, and user data displayed within the app is fetched in real time directly from TikTok's own servers and CDN, delivered to the embedded Chromium engine exactly as if the user had opened tiktok.com in Safari.

3. Legal Basis — Why No Authorization Is Required

3.1 Public Web Content Accessibility

TikTok's web interface at tiktok.com is publicly accessible on the open internet without any license, subscription, or developer agreement. Any person may access this interface using any standard web browser (Safari, Chrome, Firefox, Edge) without obtaining permission from TikTok Inc. Our application simply provides a dedicated macOS window that loads this same publicly accessible URL.

3.2 Functional Equivalence to a Web Browser

From a technical and legal standpoint, *Apps for TikTok* functions as a purpose-specific web browser. Web browsers — including Apple's own Safari — do not require authorization from every website they render. This principle is foundational to the open web: web servers that respond to HTTP requests for public URLs implicitly grant permission to all HTTP clients (browsers, apps) to display that content to the user requesting it.

3.3 No Content Redistribution or Hosting

- The app does **not** host, store, cache, or redistribute any TikTok audio or video.
- The app does **not** transcode, download, or repackage any TikTok media streams.
- The app does **not** access TikTok's private or undocumented APIs.
- The app does **not** scrape or index TikTok content.
- The app does **not** bypass any TikTok authentication or paywall.
- The app does **not** share or resell access to TikTok accounts.

Users must possess their own TikTok accounts and authenticate directly through TikTok's official login system. The app transmits zero credentials — all authentication is handled by TikTok's own servers through their standard web login flow.

3.4 User Data Ownership

All TikTok content displayed within the app belongs to TikTok and its users, as governed by TikTok's own Terms of Service (tiktok.com/legal/terms-of-service). Our application makes no claim of ownership over any content displayed. The app's role is solely that of a rendering engine — identical in function to a web browser opening tiktok.com.

4. Mac App Store Precedent

The Mac App Store has approved and continues to distribute numerous applications using the same web-wrapper architecture. Notable examples of approved apps that wrap publicly accessible third-party web services include:

App Name	Wrapped Service	MAS Category
Mango 5Star — For TikTok	tiktok.com	Social Networking
Breezer for Twitter / X	x.com	Social Networking

Quill Chat	quill.chat	Business
Unite	Any website	Productivity
Fluid Browser	Any website	Productivity
Franz	Multiple services	Social Networking

All of the above applications render third-party web services without holding licensing agreements with those services, on the basis that those services are publicly accessible on the open web.

5. Technical Verification

The following technical facts can be independently verified by Apple's review team:

Claim	How to Verify
All content loaded from tiktok.com	Open macOS Activity Monitor → Network tab while app is running. All connections resolve to tiktok.com
No local media storage	Inspect app bundle: Contents/Resources/ contains zero audio or video files. App sandbox has no access to local media storage.
No private API usage	The app bundle contains no TikTok SDK, framework, or library. Only standard Electron/Chromium APIs are used.
Authentication via TikTok servers	Network traffic during login shows all auth requests directed to TikTok's own login endpoints (api.tiktok.com).

6. Declaration

DEVELOPER DECLARATION

I, Mihai Graure, developer of Apps for TikTok (Bundle ID: com.mihai.appsfortiktok, App Store ID: 6783051609), hereby declare under penalty of perjury that:

1. Apps for TikTok is a web-browser wrapper application that renders TikTok's publicly accessible web interface.
2. The app does not host, redistribute, transcode, or store any TikTok content.
3. All TikTok content displayed is fetched in real time from TikTok's own servers and belongs exclusively to TikTok Inc. and its content creators.
4. No private agreement, API access agreement, or content license with TikTok Inc. is required because the app accesses only TikTok's publicly available web interface, in the same manner as any standard web browser.
